State Teachers Retirement System of Ohio

Three Year Experience Review
July 1, 2008 – June 30, 2011

February 16, 2012

STRS Ohio Experience Study

I. Executive Summary

II. Experience Study Results

a. Introduction

b. Demographic Assumptions

c. Economic Assumptions

III. Appendix A

Executive Summary

Executive Summary

- An experience study is performed every three to five years for STRS Ohio to review the assumptions used in the annual actuarial valuation.
- Census data for the past three years (2008 – 2011) was collected and analyzed.
- Demographic assumptions:
 - Past experience tends to be a good indicator of future demographic experience.
- Economic assumptions:
 - Expert forecasts and observable expectations of future economic activity are more heavily relied upon for setting economic assumptions than past experience.
 - Economic expectations have changed significantly since the prior experience study.

Executive Summary

Summary of Recommended Changes

Based on the Plan's experience and current market conditions, we recommend changes to most of the current actuarial assumptions.

- **Mortality:**
 - Change healthy post-retirement mortality from RP 2000 Combined Mortality Table projected to 2018 (using Scale AA) with age setbacks for both males and females, to the RP 2000 Combined Mortality Table projected to 2022, (using Scale AA) with age setbacks for both males and females.
 - Decrease expected pre-retirement mortality rates.
 - Increase disability mortality rates for older ages.

Executive Summary

Summary of Recommended Changes

Retirement:

- Slight changes to reflect fewer retirements upon first eligibility for the age 60 with 5 years of service and age 55 with 25 years of service retirement eligibilities and minor modifications at other ages.
- Proposed Plan:
 - Expected retirement rates applied to the proposed plan differ from the expected retirement rates applied to the current plan to reflect the different retirement patterns expected under the new plan. However, the expected retirement rates for the current plan were used as the underlying basis for establishing the expected retirement rates for the proposed plan.
 - Therefore, the expected retirement rates used previously for the proposed plan have been updated, where necessary, to reflect the recommended changes listed above.

Executive Summary

Summary of Recommended Changes

- **Non-Vested Withdrawal:**

- Implement rates based on service for participants with less than 5 years of service.
 - 35% expected to terminate in the first year of employment
 - 25% in the second year of employment
 - 15% in the third year of employment
 - 10% in the fourth and fifth years of employment
- The change from age-based to service-based withdrawal assumptions, for participants with less than 5 years of service, is because we have observed that in certain professions, such as teaching, employees who leave the profession before retirement tend to do so very early in their careers, regardless of age.

Executive Summary

Summary of Recommended Changes

- **Vested Withdrawal:**
 - Decrease expected withdrawal rates for vested participants for males less than age 45 and females less than age 50.
 - Increase expected withdrawal rates for males age 45 or older and females age 50 or older.
- **Disability:** Decrease the likelihood of disability retirement at most ages.

Executive Summary

Summary of Recommended Changes

- **Dependent Assumptions:**
 - No change to the % married assumption.
 - Change the assumed age difference for female members to be 1 year younger than their spouses.
- **Inflation:** Reduce the inflation assumption from 3.00% to a rate in the range of 2.50% - 2.75%.
- **Interest Rate:** Reduce to 7.50% - 7.75% to reflect lower assumed inflation rate.

Executive Summary

Summary of Recommended Changes

- **Individual Salary Growth:** Modify the age-based salary growth assumptions to reflect the reduction in the inflation rate and slight increases in merit /promotional increases.
- **Payroll Growth:** No change.
 - Payroll growth, net of inflation, has increased on average less than 1% per year. Even though the merit pay experience analysis confirmed that those who remain employed are receiving merit increases greater than expected, the increase in total payroll has been minimal. This is due to the retirement of older, higher paid employees replaced by younger, lower paid employees. This decrease in payroll has offset the merit increases for continuing employees and thus, the total payroll has remained relatively unchanged.
 - Current data shows that the number of active employees with 30 or more years of service has declined almost 22% from 13,386 in 2008 to only 10,448 in 2011. Thus, the pattern of the last few years is not expected to continue.
 - Therefore, we recommend keeping the payroll growth assumption at the current 3.50%/4.00% rate.

Executive Summary

Impact on Funding

- The table below shows the total impact of instituting all of the assumptions recommended in this experience study on the current and proposed plans.

Measurement Date:	7/1/2011	7/1/2011	7/1/2011	7/1/2011	7/1/2011	7/1/2011	7/1/2011	7/1/2011

Experience Study Results

- Introduction
- Demographic Assumptions
 - Mortality
 - Retirement
 - Withdrawal
 - Disability
 - Dependent Assumptions
- Economic Assumptions
 - Inflation
 - Expected Return on Assets
 - Individual Salary Growth
 - Payroll Growth

Introduction

What is an experience study?

- A comparison of the actual demographic and economic experience of a plan to the current assumptions used in the actuarial valuation.

What is the purpose of an experience study?

- To ensure that the the actuarial assumptions used in the annual valuations are:
 - Reflective of the actual demographics and behaviors of the members, to the extent historical experience is measurable and expected to be an indicator of future experience, and
 - Reflective of current market conditions affecting members and their benefits.

How often is an experience study completed?

- Every 3 to 5 years.

Introduction

Are the assumption recommendations based strictly on past experience?

- Past experience is generally combined with expectations about the future for recommending assumptions.
- Past experience tends to be relied upon for setting demographic assumptions (i.e. retirement, withdrawal, disability, death, etc.), provided there is enough historical data to be credible.
 - Known aberrations are removed from the data if they do not reflect the actuary's best estimate of future experience.
- Future expectations tend to be relied upon for setting economic assumptions (i.e. inflation, asset returns, etc.)
 - Expert opinions and observable market data are considered.

Introduction

How is the past experience determined?

- Historical data, including status, age, service, and salary, for several years is collected.
 - PwC collected member census data from STRS staff for the past 3 years (July 1, 2008 – June 30, 2011).
- Past “actual” experience is compared to the “expected” experience based on the current assumptions.
 - The status of each member is tracked throughout the experience period in one-year increments, allowing us to determine the number of expected decrements and actual decrements that occurred during the period.
 - For example, if there were 5,000 members that were age 55 during the experience period (“exposed”) and 1,000 of them retired (“decremented”), the retirement experience at age 55 showed 20% likelihood of retirement.
- We also collected current and historical economic data to assist with our review of the economic assumptions.

Introduction

How is the past experience determined ?

- Keep in mind:
 - Setting assumptions is not an exact science. Data is analyzed for patterns and trends that are likely to continue in the future.
 - Assumptions are meant to be long-term expectations.

Were any modifications made to the data during the study?

- The historical data is reviewed to identify:
 - Bad data, such as errors, missing data, outliers, etc.
 - Significant events that could have caused temporary aberrations in the experience.
- Judgment is used to alter the data or weight the experience to best capture representative experience.

Demographic Assumptions – Mortality

Description

- The mortality assumption represents the probability of death and is generally an age and gender based table of rates.
- There are often separate mortality assumptions for:
 - Retirees and beneficiaries versus active and inactive members
 - Healthy members versus disabled members
- The mortality assumption for retirees and beneficiaries determines how long such members are expected to live and collect benefits.
- The mortality assumption for active and inactive members determines the likelihood of dying before retirement and receiving pre-retirement death benefits.

Demographic Assumptions – Mortality

Description

- Mortality has been consistently improving in the U.S. for generations (i.e. people are living longer), though some studies show that the trend is slowing.
 - Mortality assumptions that include projections of future mortality improvement are very common. This avoids the need to periodically update the assumption, which creates actuarial losses.
 - A fully generational table could create administrative complexity for STRS Ohio staff if internal benefit calculations would need to be updated annually.

Demographic Assumptions – Mortality

Current Assumption

- Current STRS Ohio healthy lives mortality assumption:
 - The RP 2000 Combined Mortality Table Projected to 2018 by Scale AA.
 - Males ages are set-back 2 years.
 - Females younger than 85 are set back 3 years , while females age 85 or older are set back 2 years.
- The RP 2000 Mortality Table is an industry standard table that is based on nationwide experience.
- Projection beyond 2000 to 2018 reflects expected future improvements in mortality since 2000.

Demographic Assumptions – Mortality

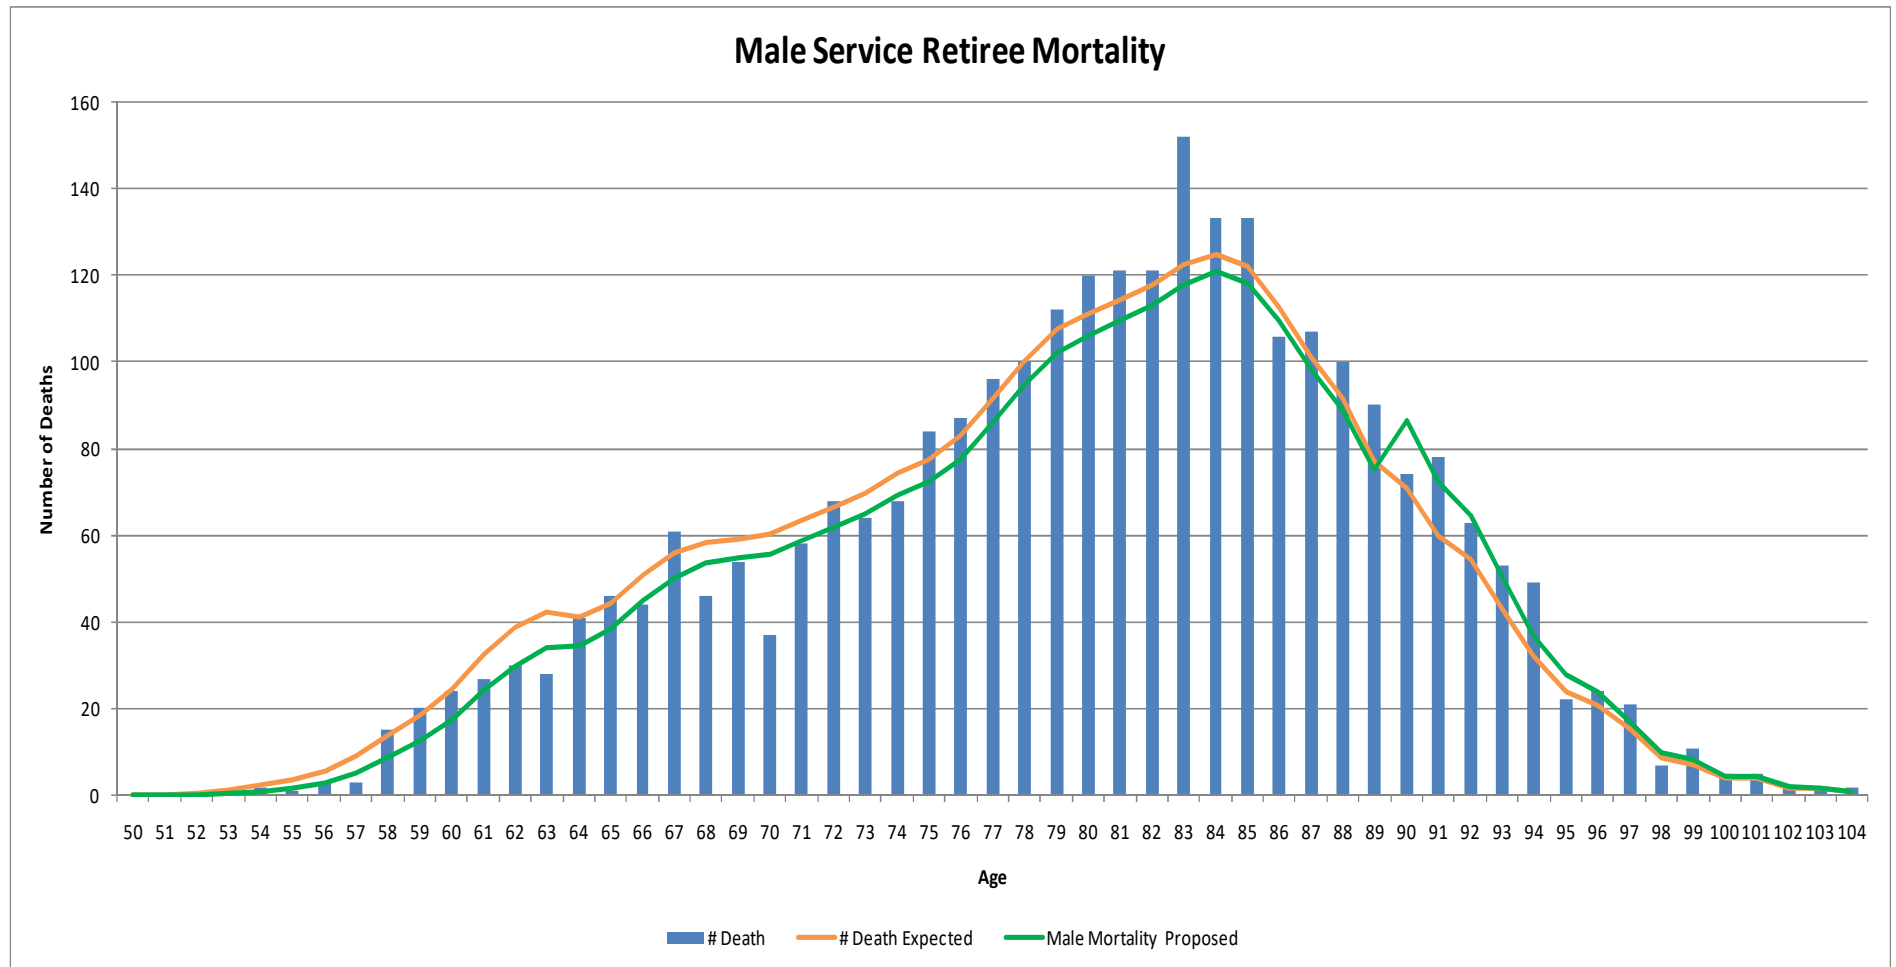

Current Assumption

- Having a *Combined* table refers to establishing one table which combines experience of annuitants and non-annuitants into one table rather than having separate tables for annuitants and non-annuitants.
 - The combined table includes adjustments at earlier ages to reflect the fact that many younger members are actively employed.
- Set-backs, set-forwards and multipliers are methods for adjusting a standard table to more closely match experience.
 - A 2-year set back means the assumed rate of mortality for a 60 year old male member is assumed to be that of a 58 year old male member.
- Special mortality tables are used for the period after disability retirement.

Demographic Assumptions – Mortality

Experience and Analysis

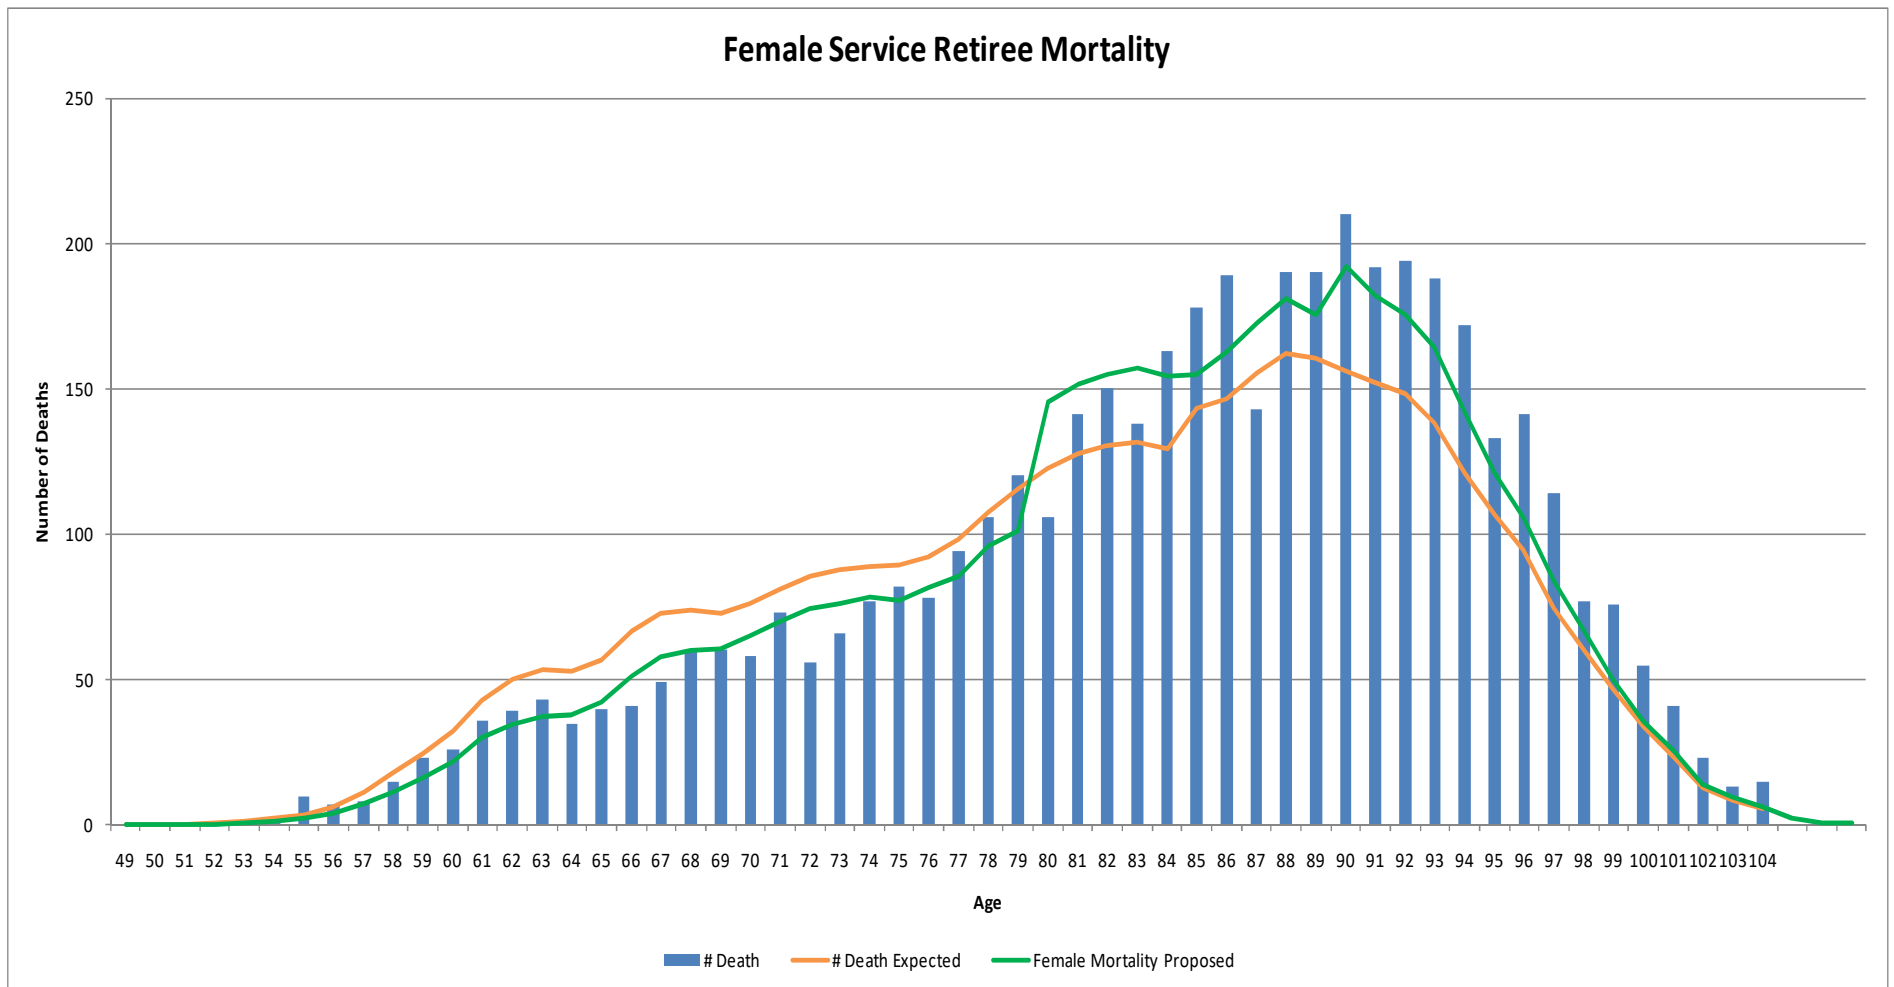

Service Retiree Mortality - Male

Demographic Assumptions – Mortality

Experience and Analysis

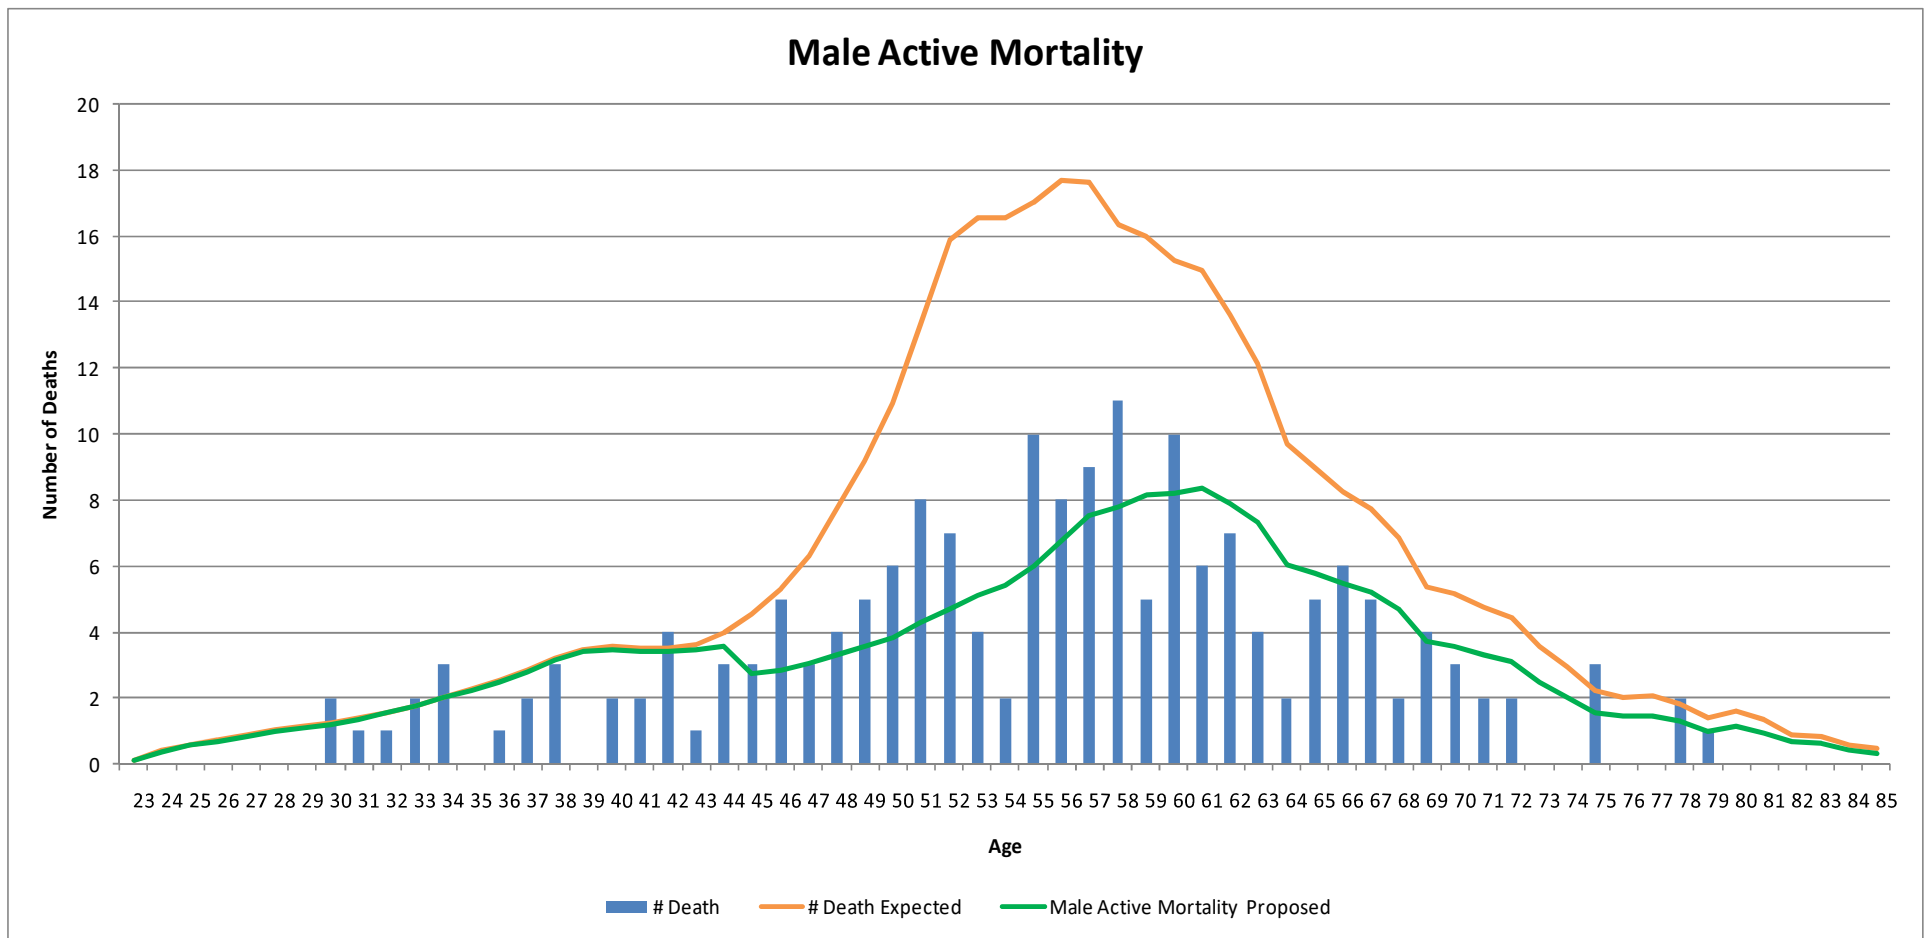

Service Retiree Mortality - Female

Demographic Assumptions – Mortality

Experience and Analysis

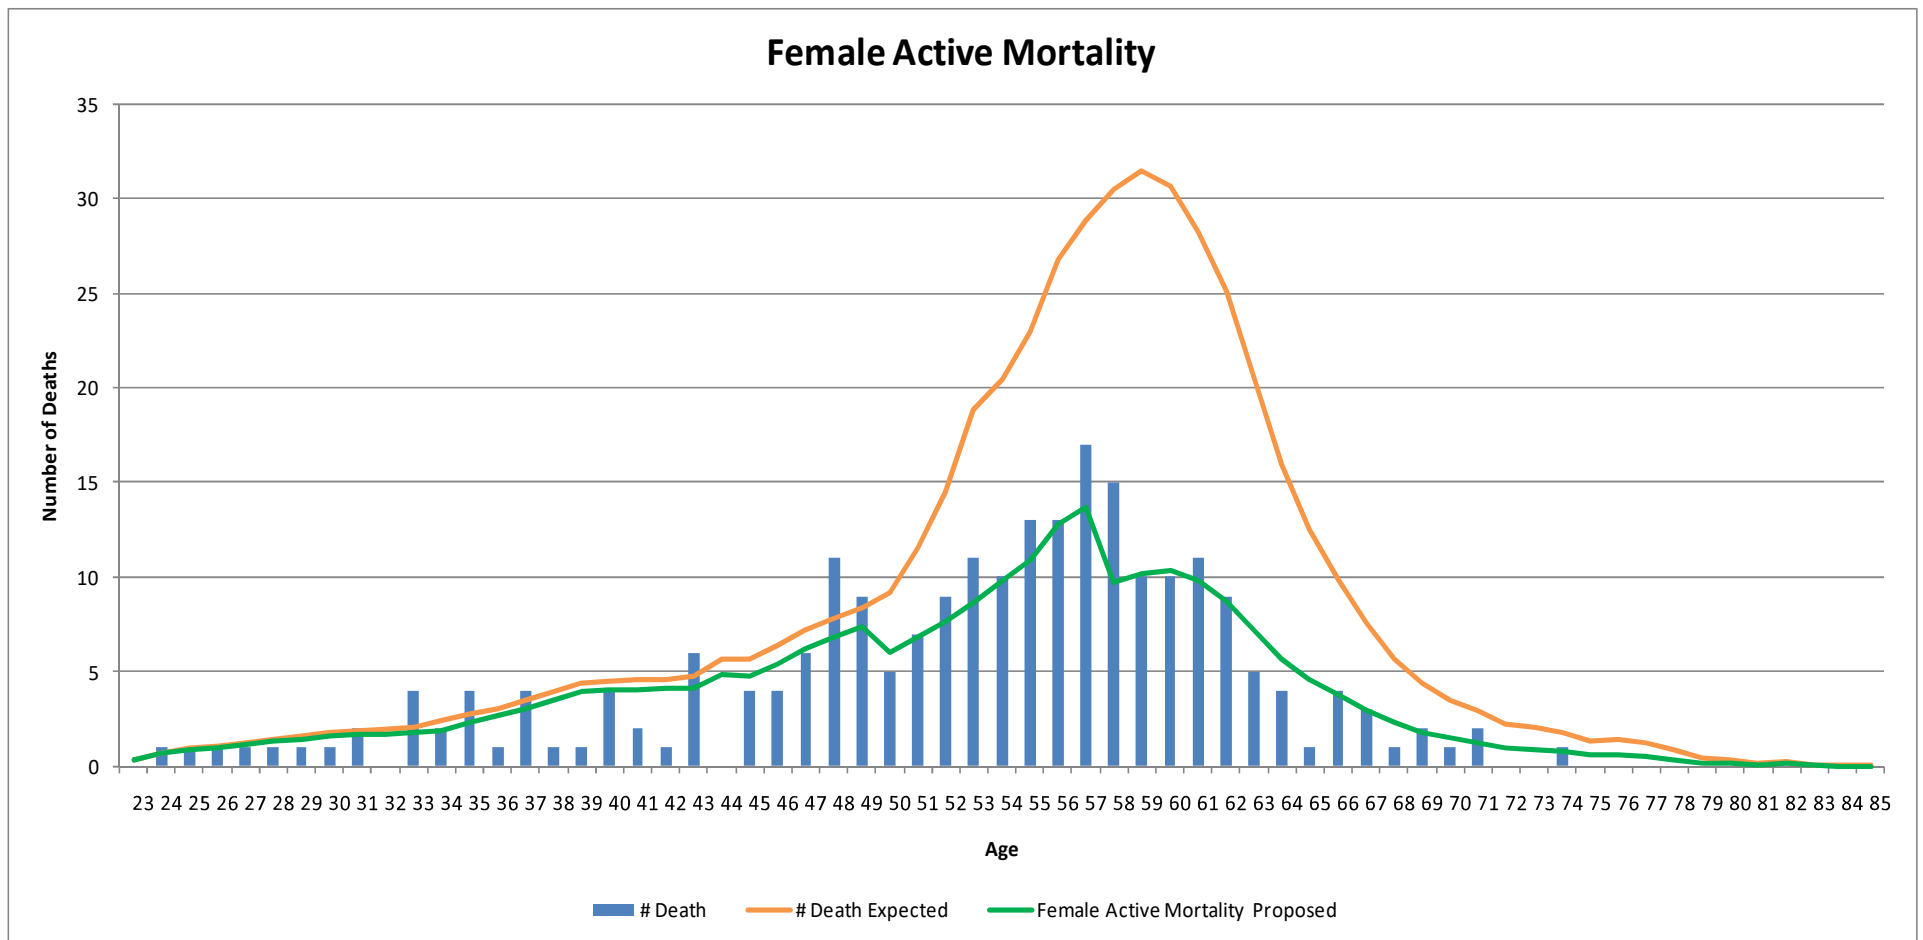

Male Active

Demographic Assumptions – Mortality

Experience and Analysis

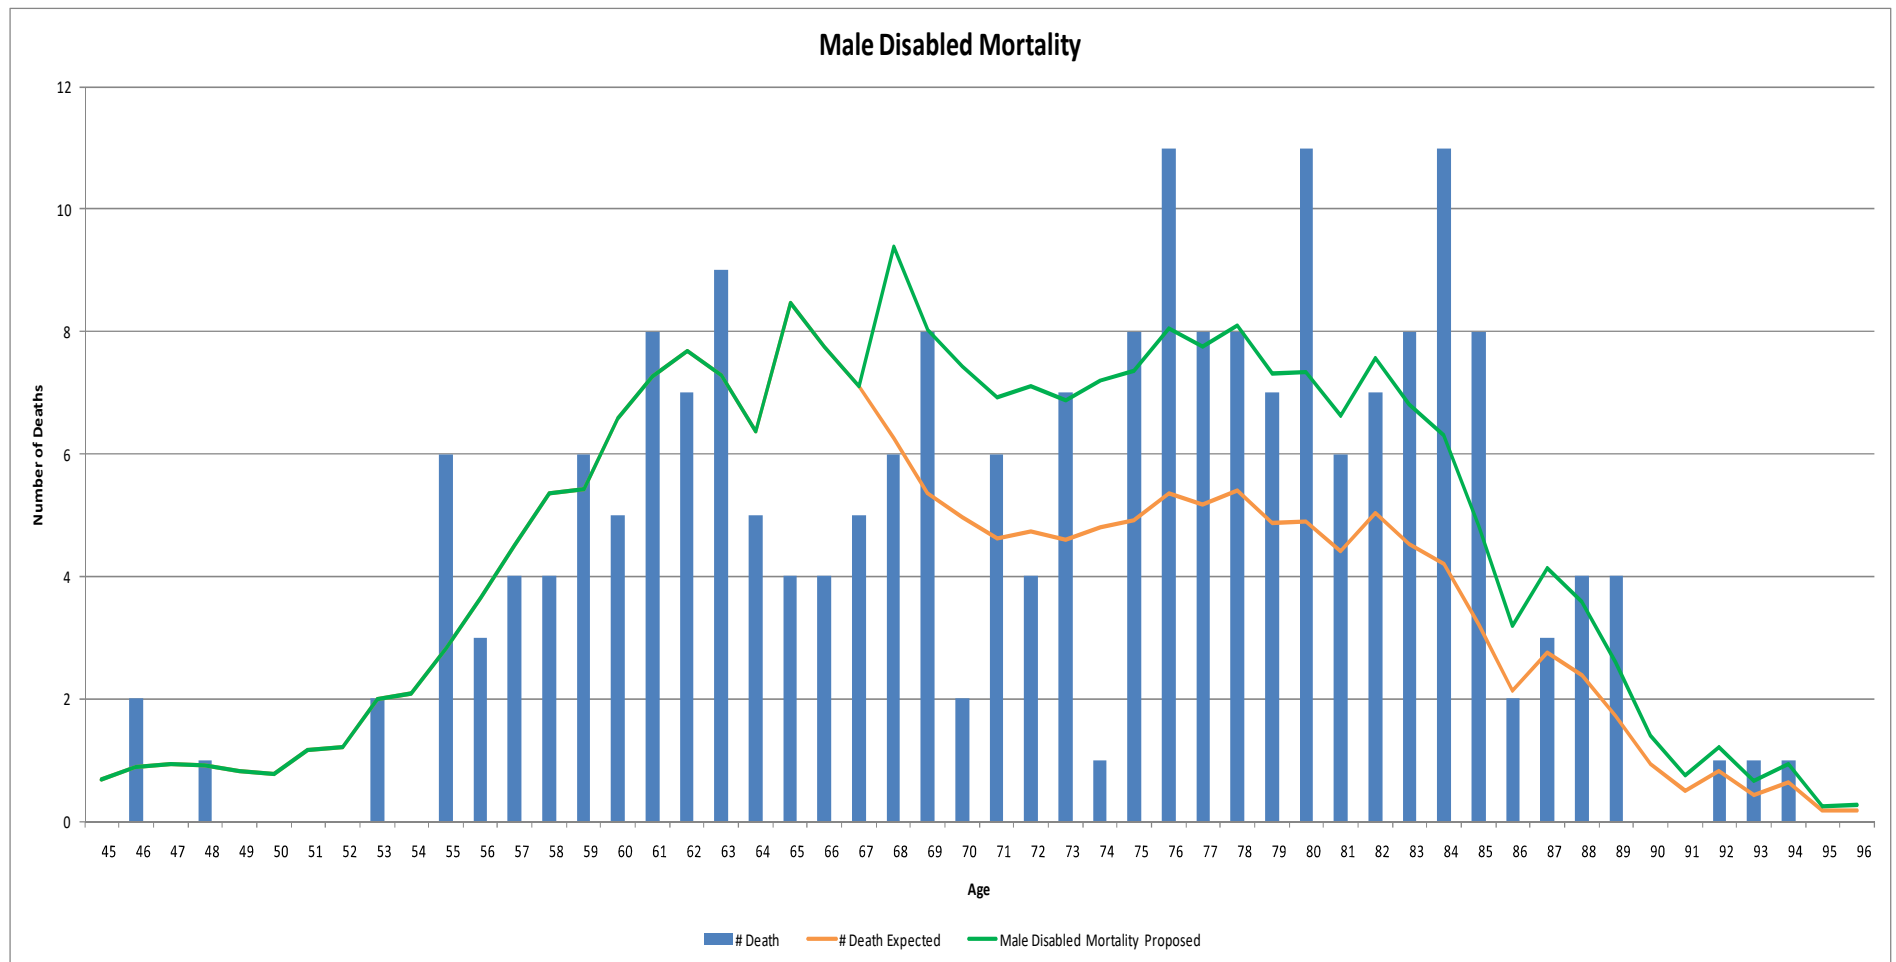

Female Active

Demographic Assumptions – Mortality

Experience and Analysis

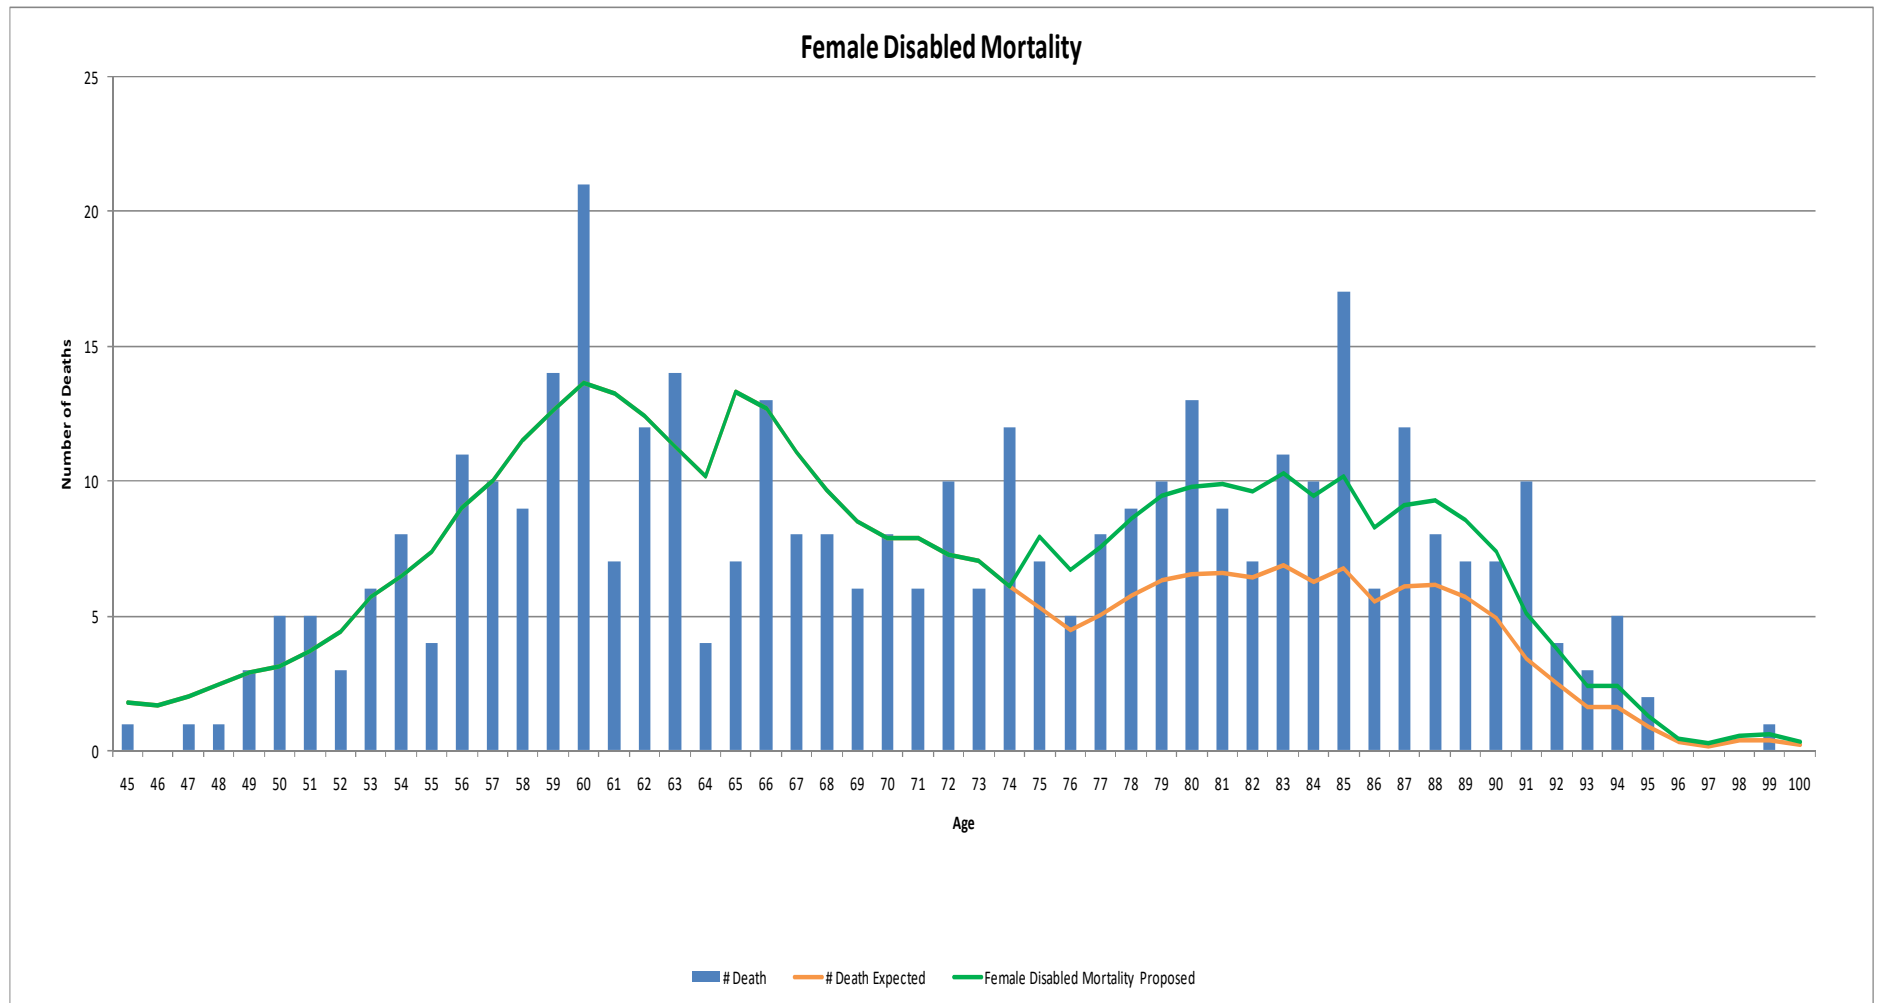

Disabled Mortality Male

Demographic Assumptions – Mortality

Experience and Analysis

Disabled Mortality Female

Demographic Assumptions – Mortality

Summary

- Actual post-retirement healthy mortality experience for males is close to expected.
- For females, actual post-retirement mortality at younger ages is less than expected and at older ages is more than expected.
- Actual pre-retirement mortality, for both males and females, is significantly less than expected.
- Actual disabled mortality is more than expected at older ages.
- The mortality assumptions should continue to factor future improvements in mortality.

Demographic Assumptions – Mortality

Recommendations

- Update to the RP 2000 Combined Mortality Table projected to 2022 (maintain 10 year mortality improvement projection).
- Post-retirement Healthy Mortality:
 - Male retirees – continue with 2 year age set-back up to age 90
 - Female retirees – change age set-backs:
 - Females younger than age 80 are set-back 4 years (as compared to current assumption of 3 year age setback)
 - Females age 80 to 89 are set-back 1 year (as compared to current assumption of 2/3 year age setbacks)
 - Males and females age 90 or older, no setback (as compared to current assumptions of 2 year age setback)
- Use same mortality assumptions for beneficiaries.

Demographic Assumptions – Mortality

Recommendations

- Pre-retirement healthy mortality (for actives and inactives) requires updating to align expected mortality with actual mortality (actual deaths were less than expected).
 - Use the same mortality table as for post-retirement with the following adjustments.:
 - Males: Rates for ages 45 and above are reduced 25%.
 - Females: Rates are reduced 25% from ages 50 – 57 and reduced 50% thereafter.
- Disability Mortality:
 - Mortality for older ages should be increased.
 - Mortality rates for males age 68 and above and females age 75 and above are increased by 50%.
- Use same mortality assumptions for the Combined Plan.

Demographic Assumptions – Retirement

Description

- The retirement assumption is used to estimate the timing of retirement.
- Retirement assumptions are generally based on age and service to reflect the eligibility requirements for retirement.
- Retirement assumptions may also be sex distinct even though the same retirement incentives apply to both males and females.

Demographic Assumptions – Retirement

Description

- The eligibility for, and value of, retirement benefits depend on a member's age and service at retirement.
 - Members of STRS Ohio Defined Benefit Plan are eligible for retirement benefits at:
 - Age 60 with 5 years of service, or
 - Age 55 with 25 years of service, or
 - 30 years of service regardless of age.
 - Members receive reduced benefits if have less than 30 years of service and are younger than age 65.
 - The retirement formula multiplier is increased for members with 31 or more years of Ohio contributing service or if have 35 or more years of service credit.

Demographic Assumptions – Retirement

Current Assumption

Demographic Assumptions – Retirement

Experience and Analysis

Service Retirement – Male with 35 or More Years of Service

Demographic Assumptions – Retirement

Experience and Analysis

Service Retirement – Female with 35 or More Years of Service

Demographic Assumptions – Retirement

Summary

- As expected, participants are waiting until they complete 35 years of service before retiring:
 - Only 15% of persons eligible to retire with less than 35 years of service do so.
 - Whereas, 47% of participants eligible to retire with 35 years of service do so.
- Actual retirements when first eligible at age 60 with 5 years of service and at age 55 with 25 years of service less than expected. Not observing as large a spike in retirement as expected.
- For participants eligible to retire with 30 years of service – less retirements than expected prior to age 57 and more retirements than expected for females above age 63.

Demographic Assumptions – Retirement

Summary

- For participants eligible to retire with 35 or more years of service – slightly more retirements than expected between the ages of 58 – 69 for both males and females.

Demographic Assumptions – Retirement

Recommendations

- For participants eligible to retire at age 60 with 5 years of service – decrease expected retirement at age 60 and increase expected retirements slightly after age 60.
 - Apply these same rates for the Combined Plan.
- For participants eligible to retire at age 55 with 25 years of service - decrease expected retirement at age 55 and make minor adjustments to expected rates at later ages.
- For participants eligible to retire with 30 years of service - decrease expected retirement for ages prior to 55 and make minor adjustments to expected rates at later ages.
- For participants eligible to retire with 35 years of service - make minor adjustments to table.
- See Appendix A for a complete list of current and proposed retirement rates.

Demographic Assumptions – Retirement

Recommendations

- Proposed Plan:
 - Expected retirement rates applied to the proposed plan differ from the expected retirement rates applied to the current plan to reflect the different retirement patterns expected under the new plan. However, the expected retirement rates for the current plan were used as the underlying basis for establishing the expected retirement rates for the proposed plan.
 - Therefore, the expected retirement rates used previously for the proposed plan have been updated, where necessary, to reflect the recommended changes listed above.

Demographic Assumptions – Withdrawal

Description

- The withdrawal assumption is used to estimate the number of members that will terminate membership prior to retirement eligibility for all causes other than death or disability.
- In general, employees are more likely to withdraw early in their careers before they are vested in their retirement benefits.
 - Withdrawal assumptions are often based on age and/or service
- The withdrawal patterns of males and females can be different for various reasons, so actuarial assumptions are often sex distinct.

Demographic Assumptions – Withdrawal

Description

- STRS Ohio members who withdraw prior to vesting (five years of service) receive a refund of the contributions they paid into the system.
- STRS members who withdraw after vesting, but before retirement eligibility, have the choice of :
 1. Taking a refund of their contributions and forfeiting the vested retirement annuity benefit that is payable at retirement age, or
 2. Leaving their contributions in the fund and receiving a lifetime annuity benefit when they reach retirement age/eligibility.

Demographic Assumptions – Withdrawal

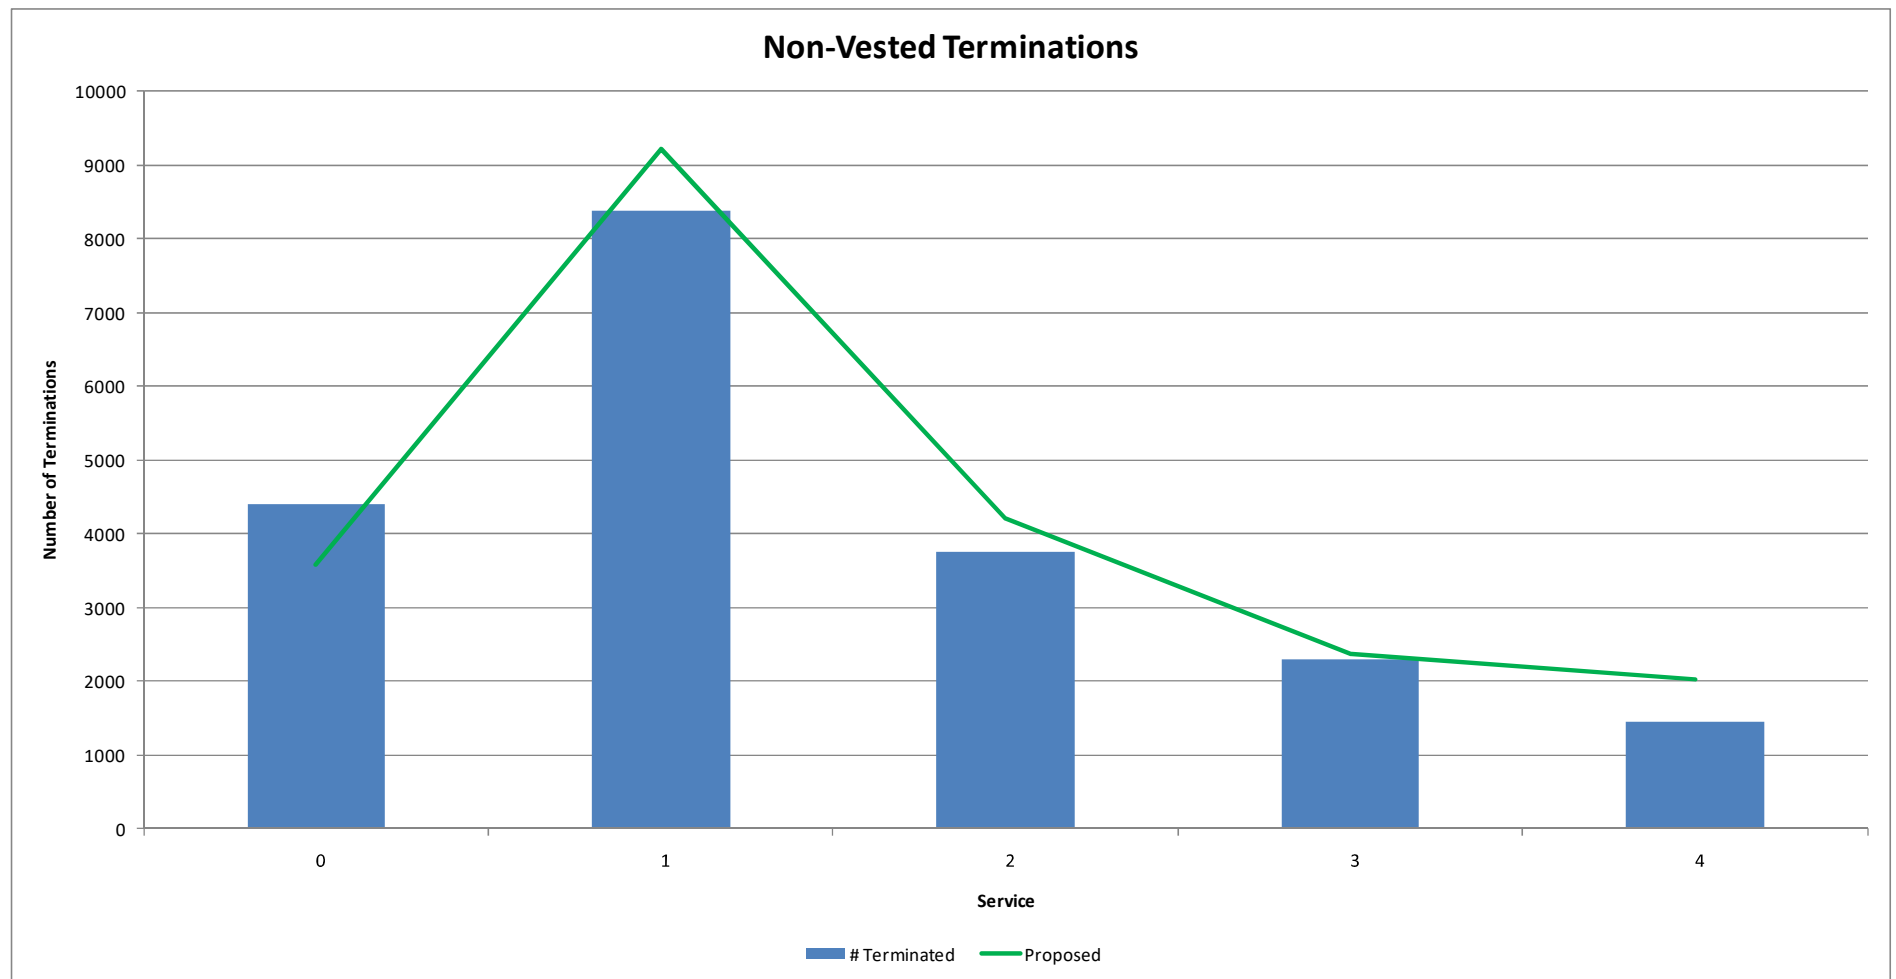

Current Assumption

<u>Age</u>	Non-Vested		Vested	
	<u>Male</u>	<u>Female</u>	<u>Male</u>	<u>Female</u>
20	24.70 %	19.50 %	15.00 %	20.00 %
25	13.60	9.99	15.00	19.00
30	12.75	9.99	3.20	6.40
35	14.50	11.75	2.61	3.60
40	13.75	9.00	2.16	2.25
45	13.40	9.00	1.90	1.80
50	13.40	9.00	1.80	2.00
55	13.40	9.00	1.80	2.40
60	13.40	7.25	1.80	2.40
65	13.40	7.25	0.00	0.00

Demographic Assumptions – Withdrawal

Experience and Analysis

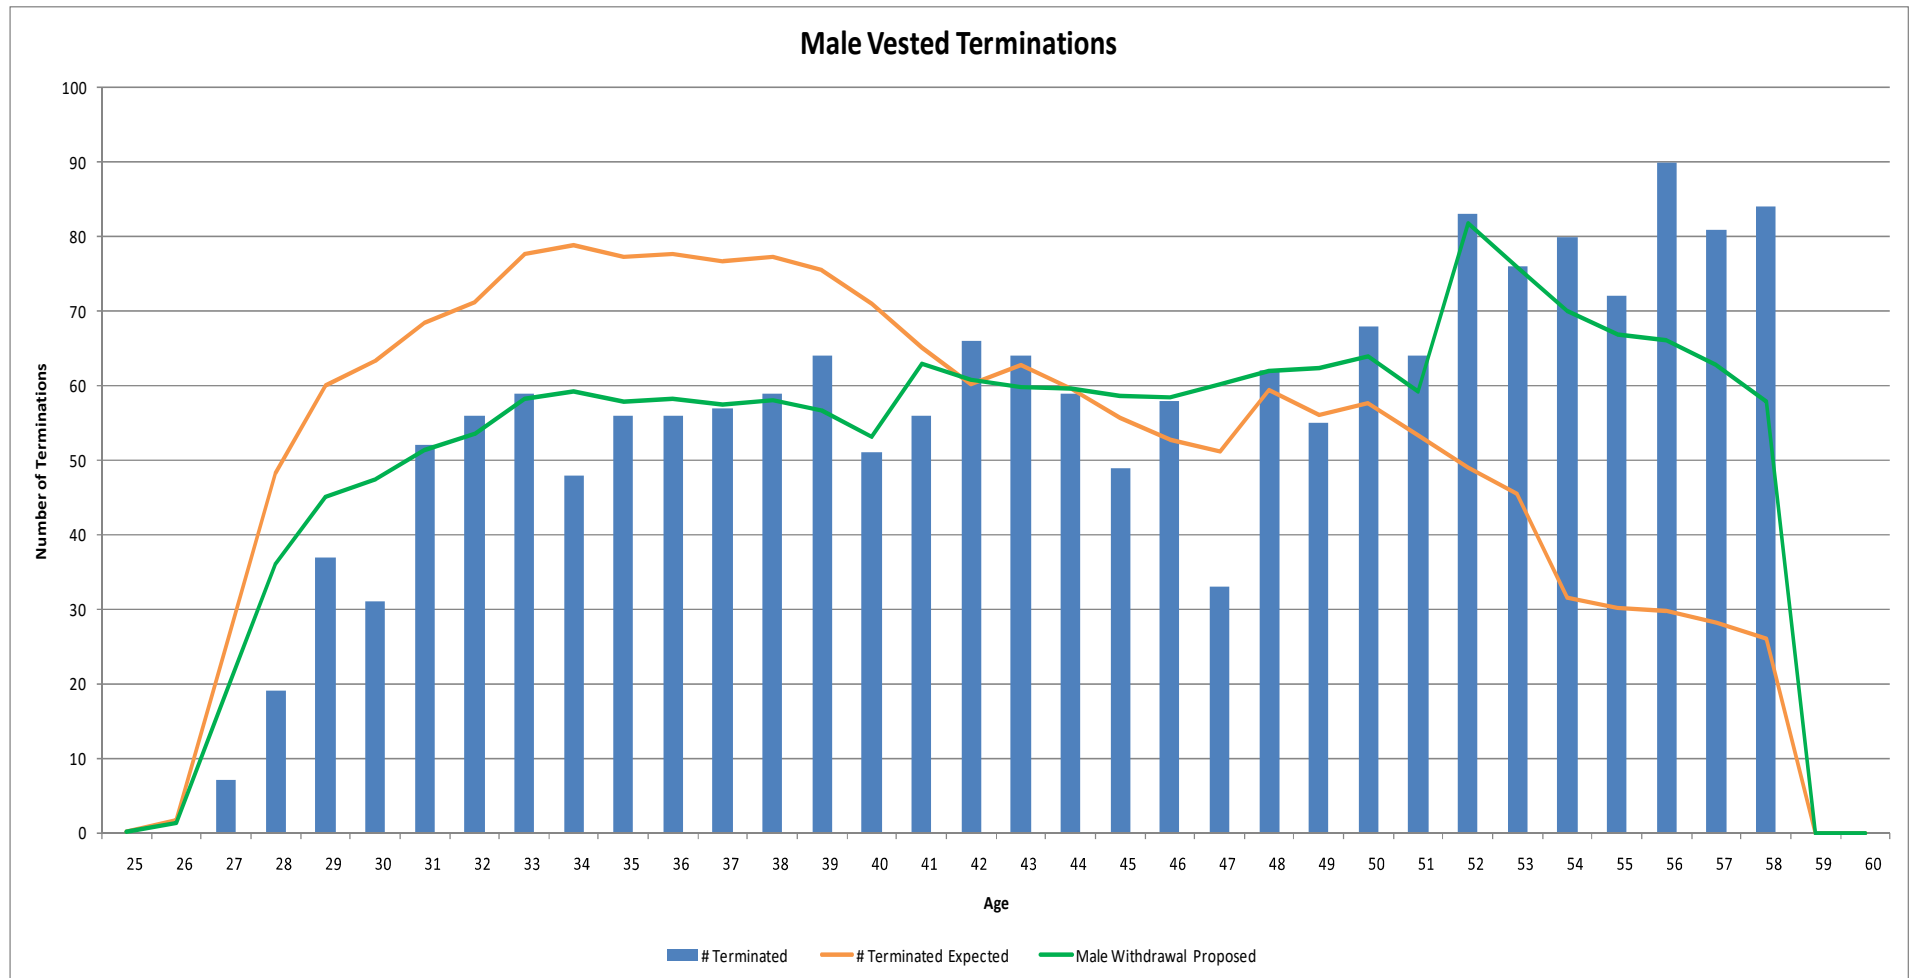

Non-Vested Terminations - Years of Service

Demographic Assumptions – Withdrawal

Experience and Analysis

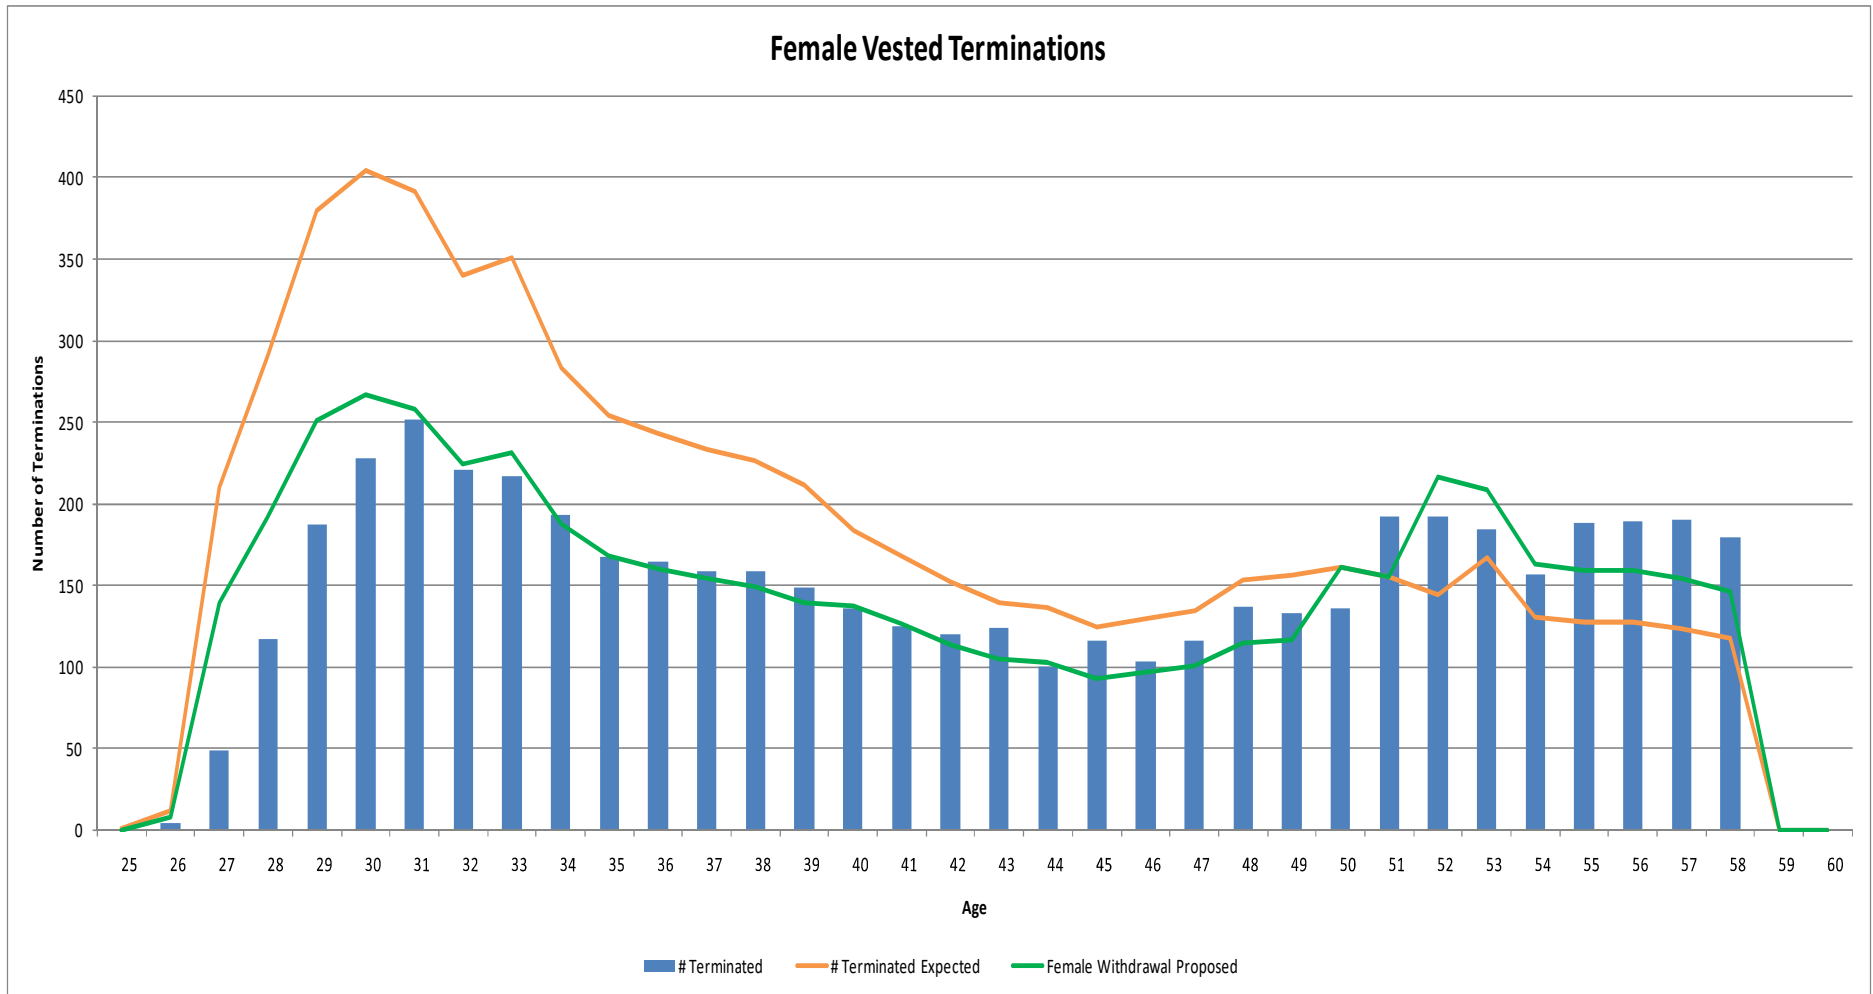

Vested Termination Males

Demographic Assumptions – Withdrawal

Experience and Analysis

Vested Termination Females

Demographic Assumptions – Withdrawal

Summary

- For non-vested terminations overall withdrawal rates did not seem to vary as much by age as by service. In addition, there were clear differences based on years of service.
- Withdrawal for vested terminations significantly less than expected at younger ages (males age 45 and females age 50).

Demographic Assumptions – Withdrawal

Recommendations

- Implement rates based on service for participants with less than 5 years of service.
 - 35% expected to terminate in the first year of employment
 - 25% in the second year of employment
 - 15% in the third year of employment
 - 10% in the fourth and fifth years of employment
- The change from age-based to service-based withdrawal assumptions, for participants with less than 5 years of service, is because we have observed that in certain professions, such as teaching, employees who leave the profession before retirement tend to do so very early in their careers, regardless of age.

Demographic Assumptions – Withdrawal

Recommendations

- Decrease expected withdrawal rates for participants with 5 or more years of service at the younger ages (males less than age 45 and females less than age 50).
- Increase expected withdrawal rates for males age 45 or older and females age 50 or older.
- Apply the same rates for the Combined Plan.
- See Appendix A for a complete list of current and proposed withdrawal rates.

Demographic Assumptions – Disability

Description

- The disability assumption is used to estimate the number of members that will terminate employment prior to retirement eligibility due to a disability.
- In general, disability assumptions tend to be age-based and sex distinct.
 - The likelihood of disability grows with age.

Demographic Assumptions – Disability

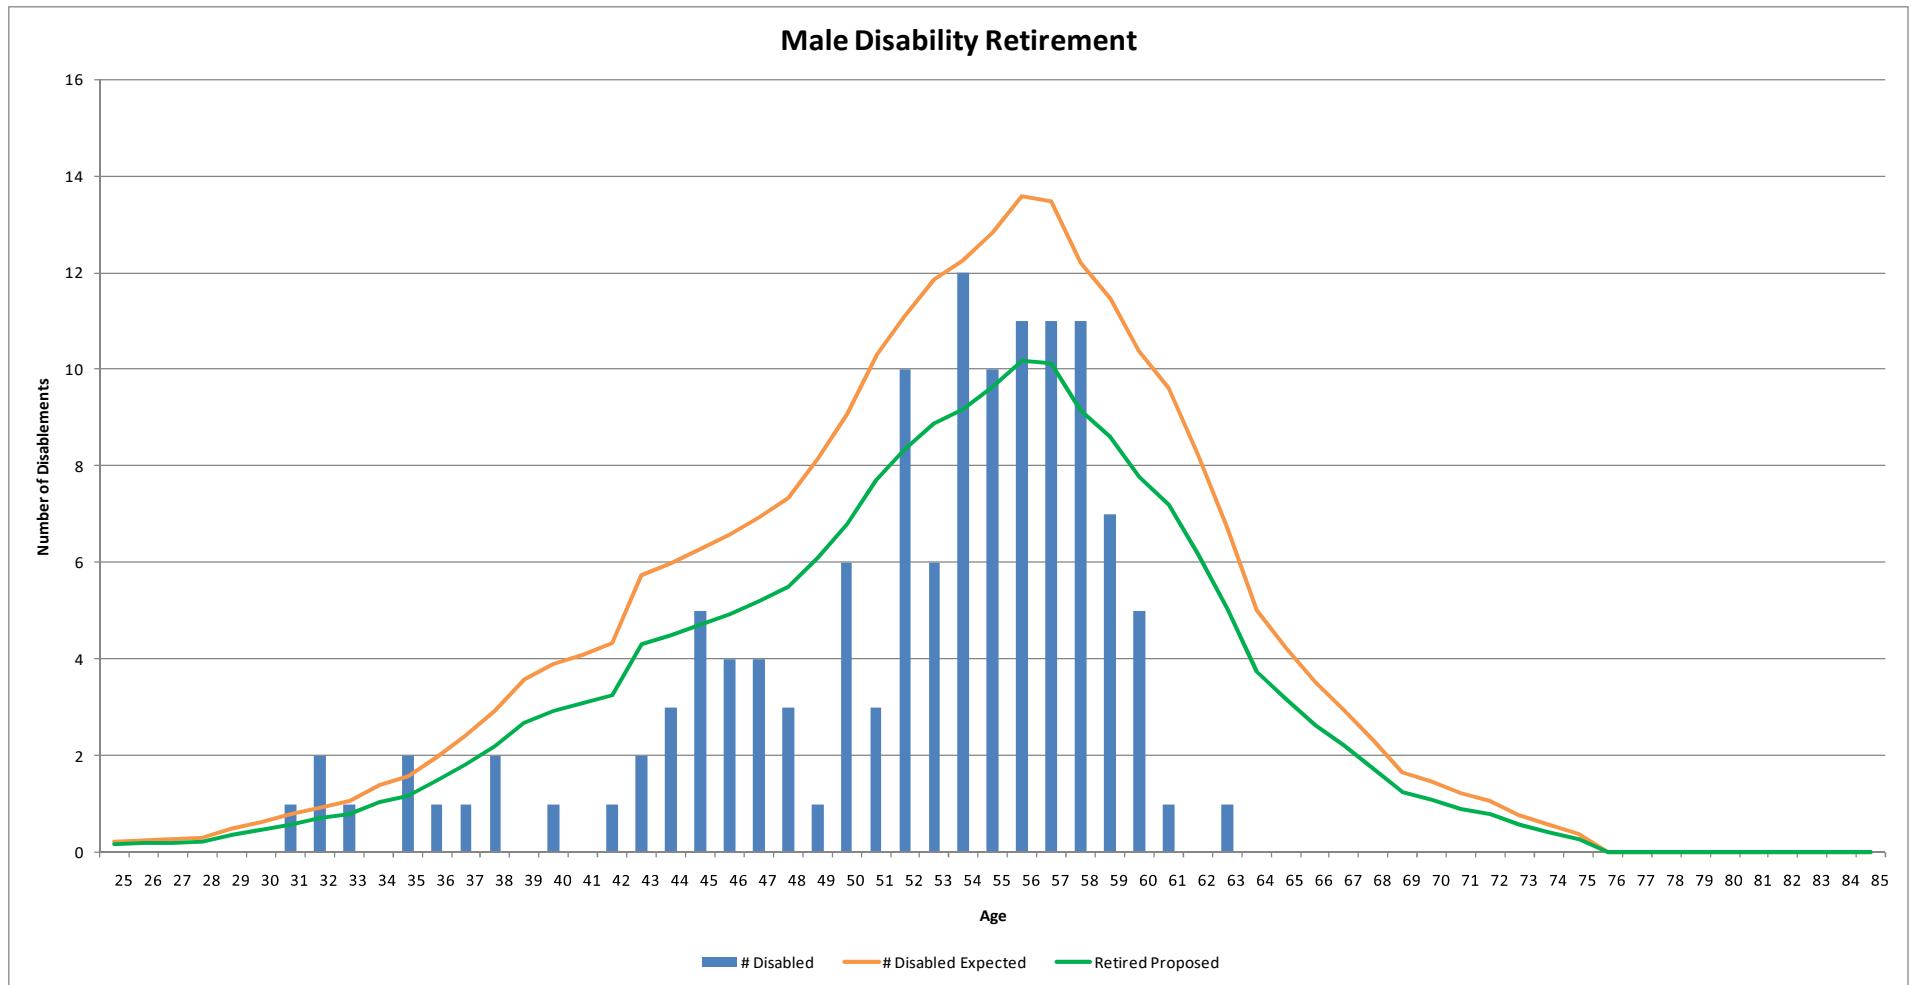

Current Assumption

<u>Age</u>		<u>Male</u>		<u>Female</u>	
20		0.01	%	0.02	%
25		0.01		0.02	
30		0.02		0.02	
35		0.04		0.07	
40		0.10		0.12	
45		0.18		0.17	
50		0.24		0.24	
55		0.30		0.30	
60		0.35		0.35	
65		0.40		0.40	

Demographic Assumptions – Disability

Experience and Analysis

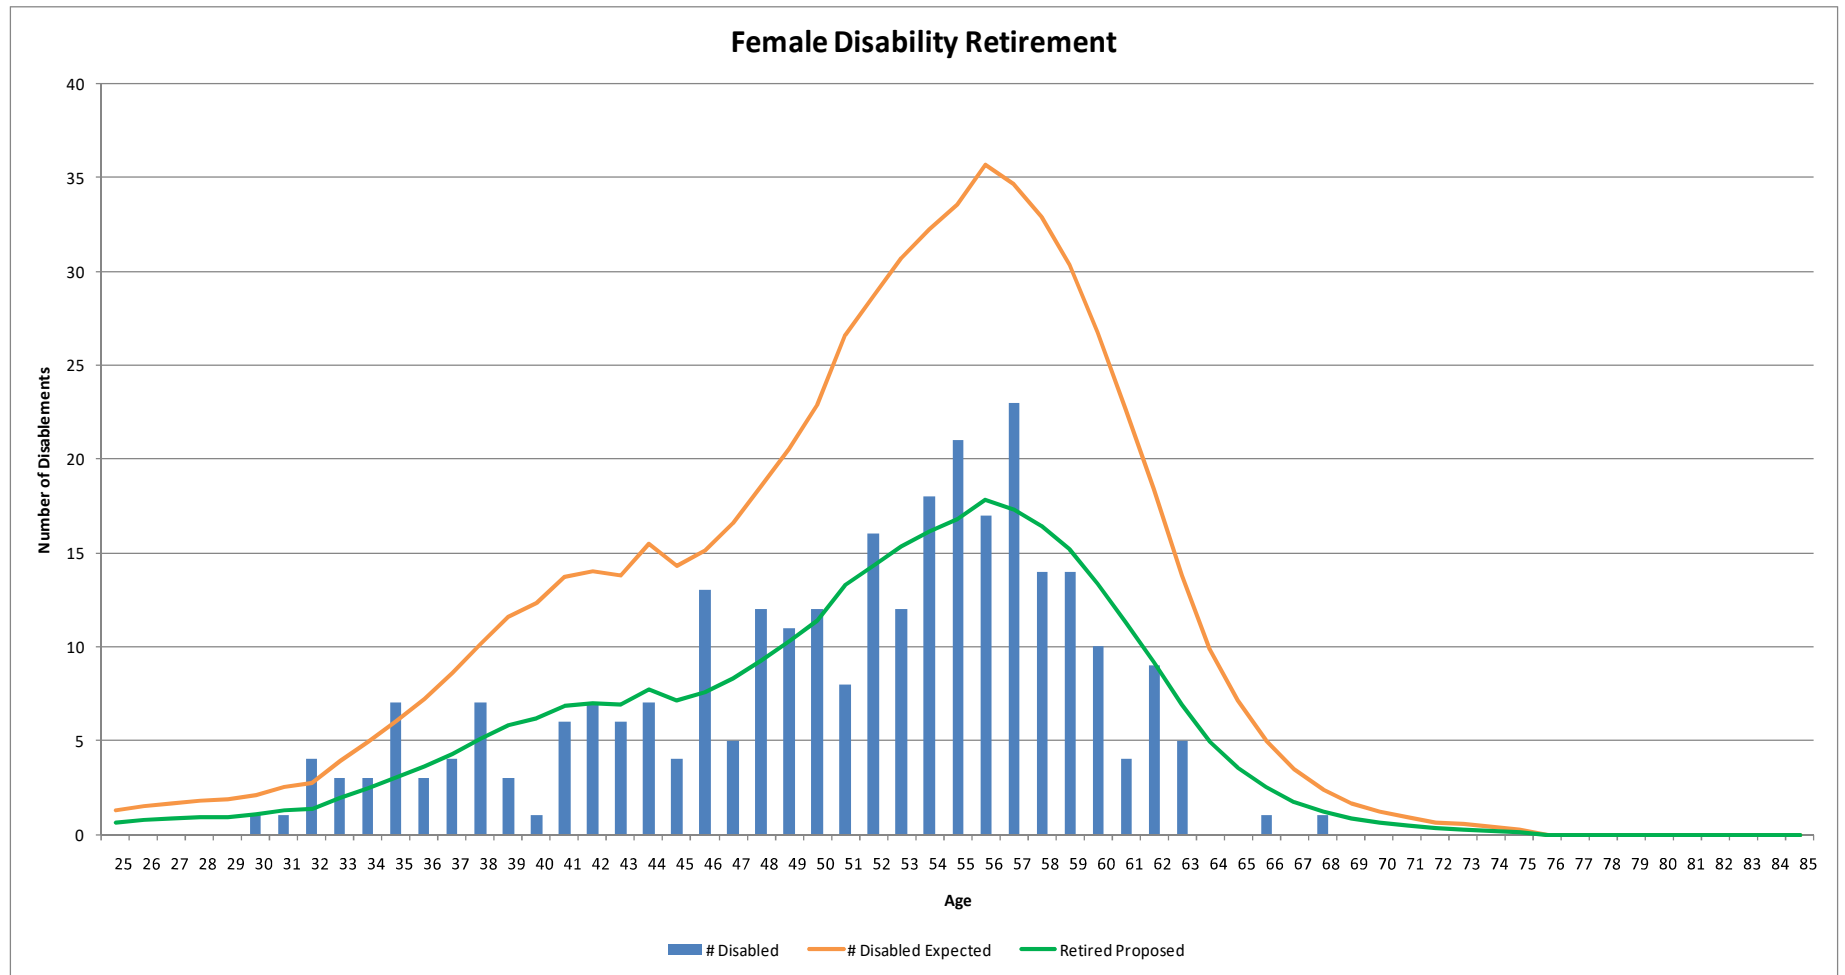

Disability Retirement Males

Demographic Assumptions – Disability

Experience and Analysis

Disability Retirement Females

Demographic Assumptions – Disability

Summary

- Overall, actual disabilities were less than expected.
- Disability experience is less credible than other events, since one or two additional disabilities can materially affect rates.

Recommendations

- For males reduce rates by 25%.
- For females reduce rates by 50%.
- Apply the same rates for the Combined Plan.

Demographic Assumptions – Dependent Assumptions

Description

- In certain circumstances, the spouse and/or dependent beneficiary(ies) of a member may be eligible to receive benefits upon the death of a member.
 - If a members dies while active or inactive and vested
 - After a member's death in retirement with a joint and survivor annuity election
- Prior to a member's retirement, spouse/beneficiary data is typically not collected and therefore assumptions are made to estimate the benefits that would be payable upon the death of a member.

Demographic Assumptions – Dependent Assumptions

Description

- Dependent assumptions typically include:
 - The percentage of members that are married or have an eligible dependent.
 - The age difference between the member and their spouse or eligible dependent.

Demographic Assumptions – Dependent Assumptions

Current Assumptions

- Marriage – 80% of male members and 60% of female members are assumed to be married.
- Age difference – Male spouses are assumed to be 3 years older than female spouses.

Demographic Assumptions – Dependent Assumptions

Experience and Analysis

- Marriage – New Retirees

Male Members:

Experience and Analysis

- Age Difference – Current Retirees
 - Spouse/Dependent data is most reliable for retired members who have elected a joint and survivor form of benefit. Prior to retirement spouse/dependent data is generally not collected.

Male Members:				
Experience Year	# Retired	Member Age	Beneficiary Age	Difference
2008	29,828	68.73	65.66	3.07
2009	30,315	69.12	66.08	3.04
2010	30,836	69.47	66.44	3.03
2011	24,406	71.37	68.26	3.11
Total	115,385	69.59	66.53	3.06
Female Members:				
Experience Year	# Retired	Member Age	Beneficiary Age	Difference
2008	27,554	67.04	67.98	(0.94)
2009	28,702	67.28	68.20	(0.92)
2010	30,096	67.42	68.32	(0.90)
2011	25,326	68.60	69.50	(0.90)
Total	111,678	67.56	68.47	(0.92)

Demographic Assumptions – Dependent Assumptions

Experience and Analysis

- Age Difference – New Retirees
 - Spouse/Dependent data is most reliable for retired members who have elected a joint and survivor form of benefit. Prior to retirement spouse/dependent data is generally not collected.

Male Members:				
Experience Year	# Newly Retired	Member Age	Beneficiary Age	Difference
2008-2009	1,132	60.16	57.54	2.62
2009-2010	1,237	60.44	57.65	2.79
2010-2011	1,280	60.52	57.86	2.66
Total	3,649	60.38	57.69	2.69
Female Members:				
Experience Year	# Newly Retired	Member Age	Beneficiary Age	Difference
2008-2009	1,687	59.47	60.57	(1.10)
2009-2010	2,170	59.88	61.05	(1.17)
2010-2011	2,583	60.11	61.22	(1.11)
Total	6,440	59.86	60.99	(1.13)

Demographic Assumptions – Dependent Assumptions

Recommendation

- Continue to assume 80% of male participants are married and 60% of female participants are married.
- Continue to assume female spouses are 3 years younger than male members.
- Change the assumption for male spouses to be only 1 year older than female members rather than 3 years older. Supported by new retirees and current retirees.
- Apply the same assumptions for the Combined Plan.

Economic Assumptions – Inflation

Description

- Inflation represents the annual increase in the cost of living.
- There are several published indices that track inflation over time, the most common of which is the Consumer Price Index for Urban Consumers that is published by the U. S. Department of Labor’s Bureau of Labor Statistics.
 - Otherwise known as the “CPI-U” index.
- Inflation is one of the “building blocks” of most economic actuarial assumptions, such as:
 - Expected asset returns (inflation + real return)
 - Individual salary (inflation + productivity + merit/promotion)
 - Total payroll growth (inflation + real wage growth)

Economic Assumptions – Inflation

Description

- For the Combined Plan, inflation is a determinant factor in the cost of living adjustment granted to certain retirees.
- Inflation component of each economic actuarial assumption should be consistent.

Economic Assumptions – Inflation

Current Assumption

- The current inflation assumption is 3.00% compounded annually.

Experience

- Historic U. S. inflation, as measured by the CPI-U index in June of each year:

<i>CPI-U Index (Historic U.S. Inflation)</i>		
<i>Date</i>	<i>CPI-U</i>	<i>Annual Increase</i>
<i>Jun-2008</i>	<i>218.85</i>	
<i>Jun-2009</i>	<i>215.693</i>	<i>-1.44%</i>
<i>Jun-2010</i>	<i>217.963</i>	<i>1.05%</i>
<i>Jun-2011</i>	<u><i>225.722</i></u>	<u><i>3.56%</i></u>
<i>Average</i>		<i>1.06%</i>

Economic Assumptions – Inflation

Analysis

- With regard to inflation, historical experience is generally given less weight in terms of setting future expectations.
 - There are a number of factors that can change the economic outlook very quickly
- Current market conditions and the expectations of economists and other financial experts are weighed more heavily in setting inflation assumptions.
 - Observable data in this regard can be pulled from the financial markets by analyzing the difference in yields between fixed coupon U. S. Treasury bonds and inflation-protected U. S. Treasuries (“TIPS”).
 - As of 2/1/2012, yields on Treasuries and TIPS for various maturities were as follows:

Security	Maturity				
	5 Years	7 Years	10 Years	20 Years	30 Years
US Treasuries	0.72%	1.27%	1.87%	2.65%	3.01%
US TIPS	-1.17%	-0.78%	-0.28%	0.42%	0.65%
Expected Inflation	1.89%	2.05%	2.15%	2.23%	2.36%

Economic Assumptions – Inflation

Summary

- In recent years, inflation has averaged between -1.50% and 3.50%.
- Long-term future inflation expectations based on the yields of Treasuries and TIPS is roughly 2.30%.

Recommendation

- We recommend an inflation assumption in the range of 2.50% - 2.75%.

Economic Assumptions – Expected Return on Assets

Description

- The expected return on assets is typically derived by weighting the expected returns of each type or class of security to which funds are allocated and invested.
 - The expected investment return of any financial security includes the following components:
 - Inflation
 - Risk-free real returns
 - Risk premium
- Past investment experience is generally not a good predictor of future performance, given the volatility of the financial markets and other factors that can significantly impact the financial markets.
- The advice and expectations of professional asset managers are generally sought to help in developing the asset return assumption.

Economic Assumptions – Expected Return on Assets

Current Assumption

- The current expected return on assets assumption is 8.00% annually, net of administrative and investment expenses. Based on a 3.00% inflation rate, this assumes a 4.85% real rate of return.

Recommendation

- The Callan report shows that based on a 2.5% inflation assumption, expected returns over the near term are expected to be 7.60%, prior to administrative expenses.
- As of June 30, 2010, 8.00% was the average and most commonly used rate by Public Employee Retirement Systems. Since that time, the trend has clearly been to reduce the rates.
- While an 8.00% or higher rate of return is possible, at this time, based on the very low yield rates on bonds, we remain comfortable with a 4.85% real rate of return and a nominal rate of return in the range of 7.50% - 7.75% (depending on rate of inflation adopted), net of administrative and investment expenses.

Economic Assumptions – Individual Salary Growth

Description

- The retirement benefits for STRS Ohio are based upon a member's final average salary.
 - Salary is typically the highest in the final years of employment.
 - Estimating each member's benefit for the actuarial valuation requires us to project salary for future years of employment.
- The individual salary growth assumption consists of the following components:
 - Inflation
 - Productivity (real wage growth)
 - Merit and promotional increases

Economic Assumptions – Individual Salary Growth

Description

- Comparing overall salary increases with those expected can mask the separate effects of inflation and real wage increases
- Non-inflationary salary increases can be measured in separately by analyzing salary growth, net of inflation.

Economic Assumptions – Individual Salary Growth

Current Assumption

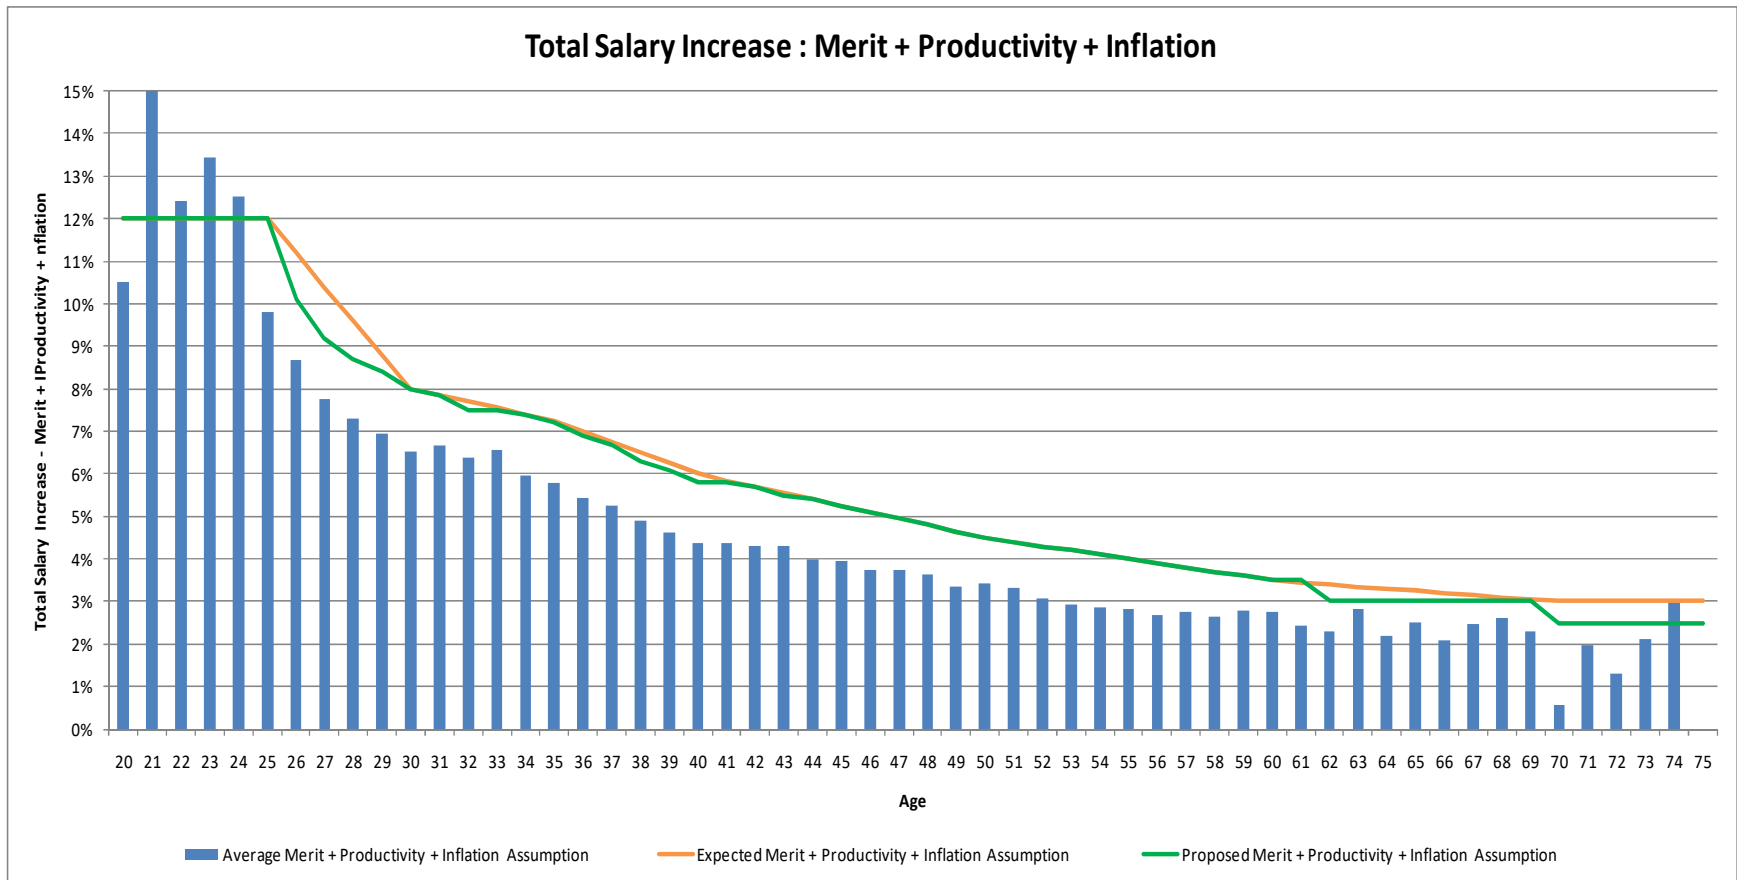

- The current individual salary growth assumption includes 3.00% for inflation.

		Total Salary Increase		Salary Increase Net of Inflation	
<u>Age</u>		<u>Rate</u>		<u>Rate</u>	
20		12.00	%	9.00	%
25		12.00		9.00	
30		8.00		5.00	
35		7.25		4.25	
40		6.00		3.00	
45		5.25		2.25	
50		4.50		1.50	
55		4.00		1.00	
60		3.50		0.50	
65		3.25		0.25	

Economic Assumptions – Individual Salary Growth

Experience and Analysis

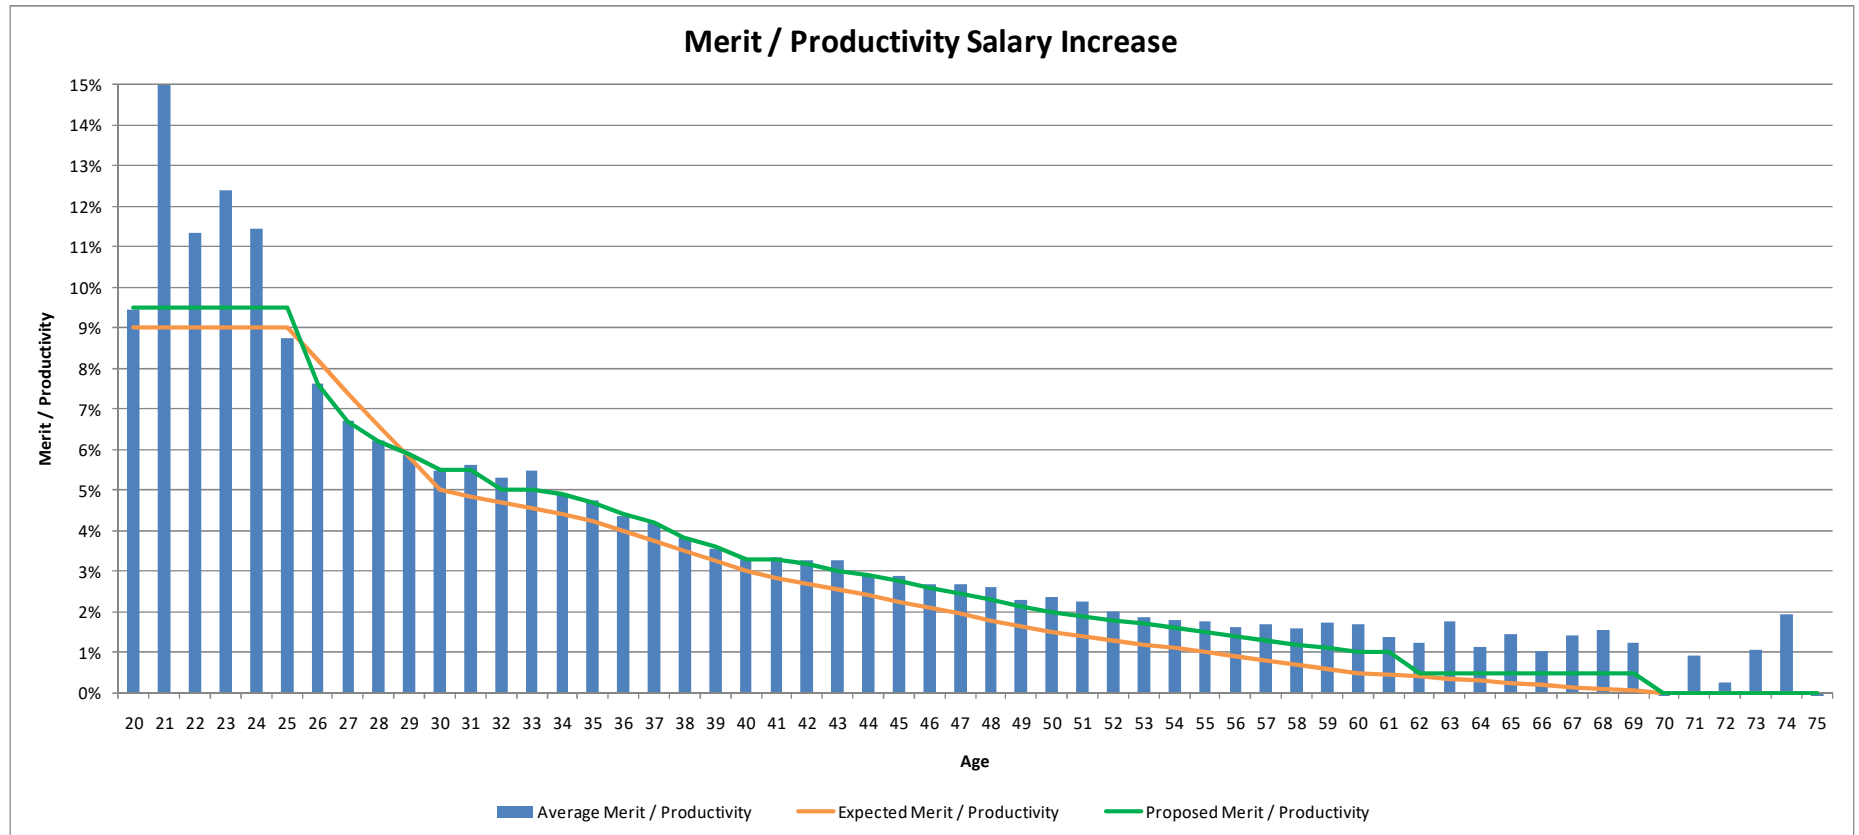

- The graph below compares the average annual increases from 2008-2011 to the current and proposed assumptions.

Economic Assumptions – Individual Salary Growth

Experience and Analysis

- The following table shows individual salary growth experience, net of inflation (actual increases shown are net of the increase in the CPI-U index).

Economic Assumptions – Individual Salary Growth

Summary

- Overall, the salary experience has been favorable as a result of the low level of inflation during 2 of the last 3 years.
 - Inflation has averaged 1.06% in the last three years rather than the assumed rate of 3.00%.
- Actual merit increases have been greater than assumed.
 - Had inflation been 3%, and the same merit increases were granted, we would have experienced actuarial losses.

Economic Assumptions – Individual Salary Growth

Recommendations

- Assume inflation in the range of 2.5% - 2.75%.
- Increase merit / productivity rates based on experience.
- See Appendix A for a full comparison of proposed vs. current salary increase assumptions.

Economic Assumptions – Payroll Growth

Description

- The current method used for amortizing unfunded past service liabilities is to amortize the unfunded actuarial accrued liability (“UAAL”) as a level percent of payroll. This requires an assumption of future payroll growth.
- The payroll growth assumption consists of the following components:
 - Inflation
 - Real wage growth
- Real wage growth can be measured by analyzing wage growth, net of inflation.
- For GASB purposes, the payroll growth assumption is not to include expected growth in population.

Economic Assumptions – Payroll Growth

Current Assumption

- The current payroll growth assumption is 3.50% compounded annually for the next 7 years and 4.00% thereafter.
- This reflects an inflation assumption of 3.00% and 1.00% real wage growth for a total of 4.00%.
- The assumption of 3.50% for the next 7 years incorporates an adjustment to 2018 to anticipate continued migration to the DC plan.

Economic Assumptions – Payroll Growth

Experience and Analysis

- The following table shows historic STRS Ohio payroll growth, as well as growth net of inflation.

<u>June 30</u>	<u>Plan</u>	<u>Total Payroll</u>	<u>Number of Active Members</u>	<u>Average Pay Per Active Member</u>	<u>Growth in Average Pay</u>	<u>Inflation (CPI-U Index)</u>	<u>Real Growth in Average Pay</u>
2008	DB	9,650,295,720	169,014	\$ 57,097.61			
2008	CO	<u>183,910,400</u>	<u>4,313</u>	\$ 42,640.95			
Total		9,834,206,120	173,327	\$ 56,737.88			
2009	DB	9,921,161,280	170,307	\$ 58,254.57	2.03%	-1.44%	3.47%
2009	CO	<u>200,979,900</u>	<u>4,500</u>	<u>\$ 44,662.20</u>	<u>4.74%</u>	<u>-1.44%</u>	<u>6.18%</u>
Total		10,122,141,180	174,807	\$ 57,904.67	2.06%	-1.44%	3.50%
2010	DB	10,133,819,948	171,339	\$ 59,144.85	1.53%	1.05%	0.48%
2010	CO	<u>207,692,374</u>	<u>4,503</u>	<u>\$ 46,123.11</u>	<u>3.27%</u>	<u>1.05%</u>	<u>2.22%</u>
Total		10,341,512,322	175,842	\$ 58,811.39	1.57%	1.05%	0.51%
2011	DB	10,155,296,005	169,362	\$ 59,962.07	1.38%	3.56%	-2.18%
2011	CO	<u>214,071,419</u>	<u>4,583</u>	<u>\$ 46,709.89</u>	<u>1.27%</u>	<u>3.56%</u>	<u>-2.29%</u>
Total		10,369,367,424	173,945	\$ 59,612.91	1.36%	3.56%	-2.20%
					1.66%	1.04%	0.63%
					Geometric Average		Net Real Growth

Economic Assumptions – Payroll Growth

Recommendation

- We recommend no change in the payroll growth assumption.
- Payroll growth, net of inflation, has increased on average less than 1% per year. Even though the merit pay experience analysis confirmed that those who remain employed are receiving merit increases greater than expected, the increase in total payroll has been minimal. This is due to the retirement of older, higher paid employees replaced by younger, lower paid employees. This decrease in payroll has offset the merit increases for continuing employees and thus, the total payroll has remained relatively unchanged.
- Current data shows that the number of active employees with 30 or more years of service has declined almost 22% from 13,386 in 2008 to only 10,448 in 2011. Thus, the pattern of the last few years is not expected to continue.
- Therefore, we recommend keeping the payroll growth assumption at the current 3.50%/4.00% rate.

Actuarial Statement

This presentation was prepared to present the results of the 2011 Experience Study for the years July 1, 2008 through June 30, 2011 for the State Teachers Retirement System of Ohio. This document was not intended or written to be used, and it cannot be used, for the purpose of avoiding U.S. federal, state or local tax penalties. This includes penalties that may apply if the transaction that is the subject of this document is found to lack economic substance or fails to satisfy any other similar rule of law. This document has been prepared pursuant to an engagement between PricewaterhouseCoopers LLP and its Client and is intended solely for the use and benefit of that Client and not for reliance by any other person. This document may only be provided to such parties in its entirety or only with your consent or should not be relied on for any other purpose.

This 2011 Experience Study was based on the actuarial assumptions and methods as adopted by the Board of Trustees. A full summary of the actuarial assumptions and plan provisions applied in generating the results enclosed herein, can be found in our actuarial valuation report which reports the final July 1, 2011 valuation results.

In preparing the results presented in this presentation, we have relied upon information provided to us regarding the plan provisions, proposed plan changes, System members, unaudited plan assets, and benefit payments. The census data and plan asset information used in determining the results herein were collected as of July 1, 2008, July 1, 2009, July 1, 2010 and July 1, 2011. While the scope of our engagement did not call for us to perform an audit or independent verification of this information, we have reviewed this information for reasonableness but have not audited it. The accuracy of the results presented in this presentation is dependent upon the accuracy and completeness of the underlying information. The experience study has been conducted in accordance with generally accepted actuarial principles and practices.

The actuary who is responsible for the information contained in this presentation is Sheldon Gamzon. He is a member of the Society of Actuaries and the American Academy of Actuaries and is an Enrolled Actuary and meets the “General Qualification Standards of Public Statement of Actuarial Opinion in the United States” relating to the pension plans. To the best of our knowledge, the individuals involved in this engagement have no relationship that may impair or appear to impair the objectivity of our work.
